# Masterpact NT and NW

UL 489 Listed LV power circuit breakers and automatic switches

# Catalogue 2009

# The original Masterpact has set a new standard for power circuit breakers around the world

# The reliability offered by a major brand

Schneider Electric has forged a solid reputation in terms of quality and innovation, continuously integrating the latest technology in all its circuit breakers. Reliability, flexibility and simplicity have always been the top priority. Schneider Electric offers the widest range of products available on the market with frame sizes, accessories and performance characteristics meeting the requirements of all types of applications.

# **UL 489 Listing**

UL 489 Listed products have been tested to ensure they meet a number of criteria related to specific properties, hazards and conditions of use.

UL Listing represents the most widely accepted certification by consumers, regulatory organisations and industry in the United States and Canada.

# UL 489 Listed Masterpact

# **Three performance levels**

- N : for standard applications.
- H : for heavy industry with high short-circuit levels. L1 : for current-limiting capability.

Intended to raise the performance level of a switchboard when the transformer power rating is increased.

# Integration in a communications network

Masterpact can be integrated in a general supervision system to optimise installation operation and maintenance. The communication architecture is open and may be upgraded for interfacing with any protocol.

# Automatic switch versions (HF)

The automatic switches are derived directly from the circuit breakers and offer the same features and performance levels.

The HF version includes instantaneous protection to prevent closing on a short-circuit. When closed, the device is protected by an instantaneous override release.

# 3 frame sizes, 2 families

PB101942A30\_SE

The range of power Masterpact circuit breakers includes two families:

- > Masterpact NT, the world's smallest true power circuit breaker, with ratings of 800 and 1200 A
- Masterpact NW, in two frame sizes, one for 800 to 3000 A and the other for 4000 and 5000 A ratings.

**Masterpact NT** 

800 and 1200 A

<ul> <li>H 100 kA</li> <li>N 65 kA</li> <li>NW NW NW NW NW</li> <li>NW NW NW NW</li> <li>NW NW NW NW</li> </ul>

# 4000 and 5000 A

DB109896A						
	н	100 kA				
			NW 40	NW 50		

# **Optimised volumes**

# The smallest circuit breaker in the world

Masterpact NT innovates by offering all the performance of a power circuit breaker in an extremely small volume. The 70 mm pole pitch means a three-pole drawout circuit breaker can be installed in a switchboard section 400 mm wide and 400 mm deep.

# Practical installation solutions

The Masterpact NW range further improves the installation solutions that have built the success of its predecessors. It has been designed to standardise switchboards, optimise volumes and simplify installation:

- incoming connection to top or bottom terminals
- > no safety clearance required
- > connection:
  - horizontal or vertical rear connection
  - front connection with minimum extra space (NT only)
  - mixed front and rear connections
- > 115 mm pole pitch on all versions.

# **Optimised volumes**

Up to 3000 A, Masterpact NW circuit breakers are all the same size, the same as the old M08 to 32 range.

# **Ease of installation**

Vertical and horizontal rear connection of a fixed Masterpact NW.

PB101572A45\_SE

Horizontal rear and front connection of a drawout Masterpact NT.

PB101577A45\_SE

Clusters fixed on a Masterpact NW device.

PB101573A45\_SE

Clusters fixed on a Masterpact NT device.

With optimised sizes, the Masterpact NT and NW ranges simplify the design of switchboards and standardise the installation of devices:

- > a single connection layout for Masterpact NT
- > three connection layouts for Masterpact NW:
  - one from 800 to 3000 A
  - one for 4000 A
  - one for 5000 A
- identical connection terminals from 800 to 5000 A (Masterpact NW)
- > front connection in minimum space
- rear connection to vertical or horizontal busbars simply by turning the connectors 90°.
- > disconnecting contact clusters fixed on the device.

# Innovation

Filtered breaking.

Navigation buttons on a Micrologic P control unit.

# Greater dependability... Filtered breaking

The patented design of the arc chutes includes stainless-steel filters. The chutes absorb the energy released during breaking, thus limiting the stresses exerted on the installation. They filter and cool the gases produced, reducing effects perceptible from the outside.

# More intelligent trip units...

Today, with the high speed of calculation, the small size of memories and advances in miniaturisation, trip units have become circuit breaker control units offering increasingly powerful functions. They accurately measure system parameters, instantly calculate values, store data, log events, signal alarms, communicate, take action, etc. The Masterpact ranges, equipped with Micrologic control units, constitute both an extremely reliable protective device and an accurate measurement instrument.

# User friendly... Intuitive use...

Micrologic control units are equipped with a digital LCD display used in conjunction with simple navigation buttons. Users can directly access parameters and settings. Navigation between screens is intuitive and the immediate display of values greatly simplifies settings. Text is displayed in the desired language.

# ... backed by incomparable security

Protection functions are separate from the measurement functions and are managed by an ASIC electronic component. This independence guarantees immunity from conducted or radiated disturbances and ensures a high degree of reliability.

A patented "double setting" system for protection functions establishes: > a maximum threshold set using the control-unit dials

> fine adjustments via the keypad or remotely. The fine adjustments for thresholds (to within one ampere) and tripping delays (to within a fraction of a second) are displayed directly on the screen.

The control unit cover can be lead-sealed to prevent uncontrolled access to the dials and protect the settings.

# **Designed for the future**

# Compliance with environmental requirements

Schneider Electric fully takes into account environmental requirements, starting right from the design phase of every product through to the end of its service life:

- > the materials used for Masterpact are not potentially dangerous to the environment
- > the production facilities are non-polluting in compliance with the ISO 14001 standard
- filtered breaking eliminates pollution in the switchboard
- the energy dissipated per pole is low, making energy losses insignificant
- > the materials are marked to facilitate sorting for recycling at the end of product service life.

# Integration in a communication network

Masterpact can be integrated in a general supervision system to optimise installation operation and maintenance. The communication architecture is open, and may be upgraded for interfacing with any protocol.

# Simple extension and upgrading of installations

Installations evolve, power levels increase and new equipment is required. Masterpact is designed to adapt to these changes:

- > all control units are interchangeable
- communication with a supervision system is an option that may be added at any time
- > a reserve chassis can be pre-addressed so that system parameters do not have to be modified when a drawout device is installed at a later date
- > any future changes to the products will be designed to ensure continuity with the current ranges, thus simplifying installation extensions and upgrades.

The technical guide

This international site allows you to access all the Schneider Electric products in just 2 clicks via comprehensive range datasheets, with direct links to: • complete library: technical documents, catalogs, FAQs, brochures...

• selection guides from the e-catalog.

• product discovery sites and their Flash animations. You will also find illustrated overviews, news to which you can subscribe, the list of country contacts... These technical guides help you comply with installation standards and rules i.e.: the electrical installation quide, the protection guide, the switchboard implementation guide, the technical booklets and the co-ordination tables all form genuine reference tools for the design of high performance electrical installations. For example, the LV protection co-ordination guide - discrimination and cascading - optimises choice of protection and connection devices while also increasing markedly continuity of supply in the installations.

# Micrologic control units

(4) Ē

# Overview of functions

All Masterpact circuit breakers are equipped with a Micrologic control unit that can be changed on site. Control units are designed to protect power circuits and loads. Alarms may be programmed for remote indications.

Measurements of current, voltage, frequency, power and power quality optimise continuity of service and energy management.

# Dependability

Integration of protection functions in an ASIC electronic component used in all Micrologic control units guarantees a high degree of reliability and immunity to conducted or radiated disturbances.

On Micrologic A, P and H control units, advanced functions are managed by an independent microprocessor.

# Accessories

Certain functions require the Micrologic control unit to be combined with accessories. They are described on page A-20.

The rules governing such combinations can be found on the "www.schneider-electric.com" web site in the "E-catalog" part of the "Products" menu.

# **Micrologic name codes**

## X: type of protection

- 3 for basic protection
- 5 for selective protection
- 6 for selective + ground-fault protection.

## Y: control-unit generation

Identification of the control-unit generation. "0" signifies the first generation.

### Z: type of measurement

- A for "ammeter"
- P for "power meter"
- H for "harmonic meter".

# **Current protection**

Micrologic 3: basic protection

DB 11031

Protection: long time + instantaneous

# **Micrologic 5: basic protection**

Protection: long time + short time + instantaneous

# Micrologic 6: selective + ground-fault protection

+ short time

- + instantaneous + ground-fault

# Measurements and programmable protection

# A: ammeter

- I<sub>1</sub>, I<sub>2</sub>, I<sub>3</sub>, I<sub>N</sub>, I<sub>ground-fault</sub> and maximeter for these measurements
   Fault indications
- Settings in amperes and in seconds.
  - P: A + power meter + programmable protection
  - Measurements of V, A, W, VAR, VA, Wh, VARh, VAh, Hz, V<sub>peak</sub>, A<sub>peak</sub>, power factor and maximeters and minimeters
     IDMTL long-time protection, minimum and maximum voltage and frequency, voltage and current imbalance, phase sequence, reverse power
  - Load shedding and reconnection depending on power or current

Measurements of interrupted currents, differentiated fault indications, maintenance indications, event histories and time-stamping, etc.

## H: P + harmonics

- Power quality: fundamentals, distortion, amplitude and phase of harmonics up to the 31st order
- Waveform capture after fault, alarm or on request
- Enhanced alarm programming: thresholds and actions.

3.0 A					
5.0 A	DBION21	5.0 P	5.0 H	DBI0112	
6.0 A		6.0 P	6.0 H		

# Micrologic control units

Micrologic A "ammeter"

Micrologic A control units protect power circuits. They also offer measurements, display, communication and current maximeters. Version 6 provides ground-fault protection.

Long-time current setting and tripping delay.

- Overload signal (LED) at 1.125 Ir 2 3 Short-time pick-up and tripping delay.
- 4
- Instantaneous pick-up. Ground-fault pick-up and tripping delay. 5
- 6 7 Ground-fault test button.
- Long-time rating plug screw.
- 8 Test connector.
- 9 Lamp test, reset and battery test.
- 10 Indication of tripping cause.
- 11 Digital display.
- 12 Three-phase bargraph and ammeter.
- 13 Navigation buttons.

### Protection settings.....

Protection thresholds and delays are set using the adjustment dials. The selected values are momentarily displayed in amperes and in seconds.

## **Overload protection**

True rms long-time protection.

Thermal memory: thermal image before and after tripping.

Setting accuracy may be enhanced by limiting the setting range using a different long-time rating plug.

The long-time rating plug "OFF" enables to cancel the overload protection.

# Short-circuit protection

Short-time (rms) and instantaneous protection.

Selection of I<sup>2</sup>t type (ON or OFF) for short-time delay.

## Ground-fault protection

Residual or source ground return.

Selection of I<sup>2</sup>t type (ON or OFF) for delay.

## **Neutral protection**

On three-pole circuit breakers, neutral protection is not possible. On four-pole circuit breakers, neutral protection may be set using a three-position switch: neutral unprotected (4P 3d), neutral protection at 0.5 Ir (4P 3d + N/2), neutral protection at Ir (4P 4d).

### Zone selective interlocking (ZSI)

A ZSI terminal block may be used to interconnect a number of control units to provide total discrimination for short-time and ground-fault protection, without a delay before tripping.

### "Ammeter" measurements.....

Micrologic A control units measure the true rms value of currents. They provide continuous current measurements from 0.2 to 20 In and are accurate to within 1.5 % (including the sensors).

A digital LCD screen continuously displays the most heavily loaded phase (Imax) or displays the  $I_1, I_2, I_3, I_N, I_g$ , stored-current (maximeter) and setting values by successively pressing the navigation button.

The optional external power supply makes it possible to display currents < 20 % In. Below 0.05 In, measurements are not significant. Between 0.05 and 0.2 In, accuracy is to within 0.5 % In + 1.5 % of the reading.

# **Communication option**

In conjunction with the COM communication option, the control unit transmits the following:

- setting values
- all "ammeter" measurements
- tripping causes
- maximeter reset

Note: Micrologic A control units come with a transparent leadseal cover as standard.

# Micrologic control units

Micrologic P "power"

Micrologic P control units include all the functions offered by Micrologic A. In addition, they measure voltages and calculate power and energy values.

- Long-time current setting and tripping delay. 1
- Overload signal (LED).
- Short-time pick-up and tripping delay. 3
- Instantaneous pick-up. Ground-fault pick-up and tripping delay. 4
- 5
- Ground-fault test button. 6
- Long-time rating plug screw.
- 8 Test connector.
- Lamp + battery test and indications reset. 9
- 10 Indication of tripping cause
- 11 High-resolution screen.
- 12 Measurement display.
- 13 Maintenance indicators
- 14 Protection settings. 15 Navigation buttons.
- 16 Hole for settings lockout pin on cover.

Schneider Electric

# Protection...... 🕸 + 🗈

# **Protection settings**

The adjustable protection functions are identical to those of Micrologic A (overloads, short-circuits and ground-fault protection).

### **Fine adjustment**

Within the range determined by the adjustment dial, fine adjustment of thresholds (to within one ampere) and time delays (to within one second) is possible on the keypad or remotely using the COM option.

# IDMTL (Inverse Definite Minimum Time lag) setting

Coordination with fuse-type or medium-voltage protection systems is optimised by adjusting the slope of the overload-protection curve. This setting also ensures better operation of this protection function with certain loads.

# Neutral protection

On three-pole circuit breakers, neutral protection may be set using the keypad or remotely using the COM option, to one of four positions: neutral unprotected (4P 3d), neutral protection at 0.5 Ir (4P 3d + N/2), neutral protection at Ir (4P 4d) and neutral protection at 1.6 Ir (4P 3d + 1.6N). Neutral protection at 1.6 Ir is used when the neutral conductor is twice the size of the phase conductors (major load imbalance, high level of third order harmonics).

On four-pole circuit breakers, neutral protection may be set using a three-position switch or the keypad: neutral unprotected (4P 3d), neutral protection at 0.5 Ir (4P 3d + N/2), neutral protection at Ir (4P 4d). Neutral protection produces no effect if the long-time curve is set to one of the IDMTL protection settings.

## Programmable alarms and other protection.

Depending on the thresholds and time delays set using the keypad or remotely using the COM option, the Micrologic P control unit monitors currents and voltage, power, frequency and the phase sequence. Each threshold overrun is signalled remotely via the COM option. Each threshold overrun may be combined with tripping (protection) or an indication carried out by an optional M2C or M6C programmable contact (alarm), or both (protection and alarm).

# Load shedding and reconnection.....

Load shedding and reconnection parameters may be set according to the power or the current flowing through the circuit breaker. Load shedding is carried out by a supervisor via the COM option or by an M2C or M6C programmable contact.

### Indication option via programmable contacts

The M2C (two contacts) and M6C (six contacts) auxiliary contacts may be used to signal threshold overruns or status changes. They can be programmed using the keypad on the Micrologic P control unit or remotely using the COM option.

# **Communication option (COM)**

The communication option may be used to:

- remotely read and set parameters for the protection functions
- transmit all the calculated indicators and measurements
- signal the causes of tripping and alarms
- consult the history files and the maintenance-indicator register.
- maximeter reset.

An event log and a maintenance register, stored in control-unit memory but not available locally, may be accessed in addition via the COM option.

Note: Micrologic P control units come with a non-transparent lead-seal cover as standard.

Display of a maximum current.

Display of a power.

Display of a demand power.

Power View software.

Measurements ..... The Micrologic P control unit calculates in real time all the electrical values (V, A, W, VAR, VA, Wh, VARh, VAh, Hz), power factors and cos  $\phi$  factors.

Ľ.

The Micrologic P control unit also calculates demand current and demand power over an adjustable time period. Each measurement is associated with a minimeter and a maximeter.

In the event of tripping on a fault, the interrupted current is stored. The optional external power supply makes it possible to display the value with the circuit breaker open or not supplied.

### Instantaneous values

The value displayed on the screen is refreshed every second.

Minimum and maximum values of measurements are stored in memory (minimeters and maximeters).

Currents

Power factor	PF	Total			
Frequencies					
F	Hz				

# **Demand metering**

The demand is calculated over a fixed or sliding time window that may be programmed from 5 to 60 minutes. According to the contract signed with the power supplier, an indicator associated with a load shedding function makes it possible to avoid or minimise the costs of overrunning the subscribed power. Maximum demand values are systematically stored and time stamped (maximeter).

Currents						
demand	А	1	2	3	Ν	
	А	G-fault				
max demand	A	1	2	3	N	
	А	G-fault				
Power						
, Q, S demand	W, Var, VA	Totals				
Q. S max demand	W. Var. VA	Totals				

### **Minimeters and maximeters**

Only the current and power maximeters may be displayed on the screen.

### **Time-stamping**

Time-stamping is activated as soon as time is set manually or by a supervisor. No external power supply module is required (max. drift of 1 hour per year).

### Reset

I ī

F F

An individual reset, via the keypad or remotely, acts on alarms, minimum and maximum data, peak values, the counters and the indicators.

### Additional measurements accessible with the COM option

Some measured or calculated values are only accessible with the COM communication option:

- I peak /  $\sqrt{2}$ , (I1 + I2 + I3)/3, I unbalance
- load level in % Ir
- total power factor.

## Additional info

Accuracy of measurements (including sensors):

- voltage (V) 0.5 %
- current (A) 1.5 %
- frequency (Hz) 0.1 %
- power (W) and energy (Wh) 2 %

Display of a tripping history.

Display after tripping

RSU configuration screen for a Micrologic

# Histories and maintenance indicators...... 🖍

The last ten trips and alarms are recorded in two separate history files that may be displayed on the screen.

- Tripping history:
- □ type of fault
- □ date and time
- □ values measured at the time of tripping (interrupted current, etc.)
- Alarm history:
- □ type of alarm
- □ date and time
- □ values measured at the time of the alarm.

### All the other events are recorded in a third history file which is only accessible through the communication network.

- Event log history (only accessible through the communication network)
- Modifications to settings and parameters
- Counter resets
- □ System faults:
- □ Fallback position
- □ Thermal self-protection
- $\square$  Loss of time
- Overrun of wear indicators
- Test-kit connections
- □ etc.

Note: all the events are time stampled: time-stamping is activated as soon as time is set manually or by a supervisor. No external power supply module is required (max. drift of 1 hour per year)

# Maintenance indicators (with COM option)

A number of maintenance indicators may be called up on the screen to better plan for device maintenance:

- contact wear
- operation counter:
- cumulative total
- total since last reset.

Additional maintenance indicators are also available through the COM network, and can be used as an aid in troubleshooting:

- highest current measured
- number of test-kit connections
- number of trips in operating mode and in test mode.

# Additional technical characteristics

## Safety

Measurement functions are independent of the protection functions.

The high-accuracy measurement module operates independently of the protection module.

### Simplicity and multi-language

Navigation from one display to another is intuitive. The six buttons on the keypad provide access to the menus and easy selection of values. When the setting cover is closed, the keypad may no longer be used to access the protection settings, but still provides access to the displays for measurements, histories, indicators, etc. Micrologic is also multi-language, including the following languages: English, Spanish, Portuguese, Russian, Chinese, French, German...

# Intelligent measurement

Measurement-calculation mode:

energies are calculated on the basis of the instantaneous power values, in two manners

□ the traditional mode where only positive (consumed) energies are considered □ the signed mode where the positive (consumed) and negative (supplied) energies are considered separately.

measurement functions implement the new "zero blind time" concept which consists in continuously measuring signals at a high sampling rate. The traditional "blind window" used to process samples no longer exists. This method ensures accurate energy calculations even for highly variable loads (welding machines, robots. etc.).

### Always powered

All current-based protection functions require no auxiliary source. Voltage-based protection functions are connected to AC power via a voltage measurement input built into the circuit breaker.

### Stored information

The fine setting adjustments, the last 100 events and the maintenance register remain in the control-unit memory even when power is lost.

Micrologic control units

Micrologic H "harmonics"

Micrologic H control units include all the functions offered by Micrologic P. Integrating significantly enhanced calculation and memory functions, the Micrologic H control unit offers in-depth analysis of power quality and detailed event diagnostics. It is intended for operation with a supervisor.

# In addition to the Micrologic P functions, the Micrologic H control unit offers:

- in-depth analysis of power quality including calculation of harmonics and the fundamentals
- diagnostics aid and event analysis through waveform capture

enhanced alarm programming to analyse and track down a disturbance on the AC power system.

## Measurements.....

The Micrologic H control unit offers all the measurements carried out by Micrologic P, with in addition:

- phase by phase measurements of:
- □ power, energy
- □ power factors
- calculation of:
- □ current and voltage total harmonic distortion (THD)
- □ current, voltage and power fundamentals
- □ current and voltage harmonics up to the 31st order.

### Instantaneous values displayed on the screen

THD % υı U and Iharmonics Amplitude 3 5 7 9 11 13

Harmonics 3, 5, 7, 9, 11 and 13, monitored by electrical utilities, are displayed on the screen.

# **Demand measurements**

Similar to the Micrologic P control unit, the demand values are calculated over a fixed or sliding time window that may be set from 5 to 60 minutes.

Currents					
Idemand	А	1	2	3	Ν
	А	G-fault			
I max demand	A	1	2	3	N
	A	G-fault			
Power					
P, Q, S demand	W, Var, VA	Totals			
P, Q, S max demand	W, Var, VA	Totals			

### Maximeters

Only the current maximeters may be displayed on the screen.

# Histories and maintenance indicators

These functions are identical to those of the Micrologic P.

Note: Micrologic H control units come with a non-transparent lead-seal cover as standard.

Log.

# With the communication option

# Additional measurements, maximeters and minimeters

Certain measured or calculated values are only accessible with the COM communication option:

- I peak /  $\sqrt{2}$  (I<sub>1</sub> + I<sub>2</sub> + I<sub>3</sub>)/3, I<sub>unbalance</sub>
- Ioad level in % Ir
- power factor (total and per phase)
- voltage and current THD
- K factors of currents and average K factor
- crest factors of currents and voltages
- all the fundamentals per phase
- fundamental current and voltage phase displacement
- distortion power and distortion factor phase by phase
- amplitude and displacement of current and voltage harmonics 3 to 31.

The maximeters and minimeters are available only via the COM option for use with a supervisor.

# Waveform capture

The Micrologic H control unit stores the last 4 cycles of each instantaneous current or voltage measurement. On request or automatically on programmed events, the control unit stores the waveforms. The waveforms may be displayed in the form of oscillograms by a supervisor via the COM option. Definition is 64 points per cycle.

## Pre-defined analogue alarms (1 to 53)

Each alarm can be compared to user-set high and low thresholds. Overrun of a threshold generates an alarm. An alarm or combinations of alarms can be linked to programmable action such as selective recording of measurements in a log, waveform capture, etc.

### Event log and maintenance registers

The Micrologic H offers the same event log and maintenance register functions as the Micrologic P. In addition, it produces a log of the minimums and maximums for each "real-time" value.

# Additional technical characteristics

### Setting the display language

System messages may be displayed in six different languages. The desired language is selected via the keypad.

### **Protection functions**

All current-based protection functions require no auxiliary source. Voltage-based protection functions are connected to AC power via a voltage measurement input built into the circuit breaker.

### Measurement functions

Measurement functions are independent of the protection functions.

The high-accuracy measurement module operates independently of the protection module, while remaining synchronised with protection events.

### Measurement-calculation mode

An analogue calculation function dedicated to measurements enhances the accuracy of harmonic calculations and the power-quality indicators. The Micrologic H control unit calculates electrical magnitudes using 1.5 x In dynamics (20 x In for Micrologic P).

Measurement functions implement the new "zero blind time" concept Energies are calculated on the basis of the instantaneous power values, in the traditional and signed modes.

Harmonic components are calculated using the discrete Fourier transform (DFT).

# Accuracy of measurements (including sensors)

- voltage (V) 0.5 %
- current (A) 1.5 %
- frequency (Hz) 0.1 %
- power (W) and energy (Wh) 2 %
- total harmonic distortion 1 %.

### Stored information

The fine-setting adjustments, the last 100 events and the maintenance register remain in the control-unit memory even when power is lost.

### Time-stamping

Time-stamping is activated as soon as time is set manually or by a supervisor no external power supply module is required (max. drift of 1 hour per year).

### Reset

An individual reset, via the keypad or remotely, acts on alarms, minimum and maximum data, peak values, the counters and the indicators.

External sensor (CT).

External sensor for source ground return protection.

# Micrologic control units

# Accessories and test equipment

# **External sensors**

# External sensor for ground-fault and neutral protection

The sensors, used with the 3P circuit breakers, are installed on the neutral conductor for: neutral protection (with Micrologic P and H)

- residual type ground-fault protection (with Micrologic A, P and H).
- The rating of the sensor (CT) must be compatible with the rating of the circuit breaker:
- NT08 to NT12: TC 400/1600
- NW08 to NW20: TC 400/2000
- NW25 to NW30: TC 1000/4000
- NW40 to NW50: TC 4000/6300.

## External sensor for source ground return protection

The sensor is installed around the connection of the transformer neutral point to earth and connects to the Micrologic 6.0 control unit via an MDGF module to provide the source ground return (SGR) protection.

### Voltage measurement inputs

Voltage measurement inputs are required for power measurements (Micrologic P or H).

As standard, the control unit is supplied by internal voltage measurement inputs placed downstream of the pole for voltages between 220 and 690 V AC. On request, it is possible to replace the internal voltage measurement inputs by an external voltage input (PTE option) which enables the control unit to draw power directly from the distribution system upstream of the circuit breaker. An 3 m cable with ferrite comes with this PTE option.

# Long-time rating plug

Eight interchangeable plugs may be used to limit the long-time threshold setting range for higher accuracy.

The time delay settings indicated on the plugs are for an overload of 6 Ir. As standard, control units are equipped with the 0.4 to 1 plug.

Plug		Setting ranges I <sub>r</sub> = I <sub>n</sub> x								
	Type A (1)	0.4	0.45	0.5	0.6	0.63	0.7	0.8	0.9	1
	Туре В	0.4	0.44	0.5	0.56	0.63	0.75	0.88	0.95	1

(1) Standard

# External 24 V DC power-supply module (AD module)

The external power-supply module makes it possible to use the display even if the circuit breaker is open or not supplied (for the exact conditions of use, see the "electrical diagrams" part of this catalogue).

This module powers both the control unit (100 mA) and the M2C and M6C programmable contacts (100 mA).

If the COM communication option is used, the communication bus requires its own 24 V DC power supply, independent with respect to that of the Micrologic control unit. With the Micrologic A control unit, this module makes it possible to display currents of less than 20 % of In.

With the Micrologic P and H, it can be used to display fault currents after tripping.

# Characteristics

- Power supply:
- □ 110/130, 200/240, 380/415 VAC (+10 %, -15 %)
- □ 24/30, 48/60, 100/125 V DC (+20 %, -20 %)
- Output voltage: 24 V DC ±5 %, 200 mA
- Ripple < 1 %
- Dielectric withstand: 3.5 kV rms between input/output, for 1 minute
- Overvoltage category: as per IEC 60947-1 cat 4.

### **Battery module**

The battery module maintains display operation and communication with the supervisor if the power supply to the Micrologic control unit is interrupted. It is installed in series between the Micrologic control unit and the AD module.

### Characteristics

- Battery run-time: 4 hours (approximately)
- Mounted on vertical backplate or symmetrical rail.

M2C

Lead-seal cover.

Portable test kit

# M2C, M6C programmable contacts

These contacts are optional equipment for the Micrologic P and H control units. They are described with the indication contacts for the circuit breakers.

Characteristics			M2C/M6C
Minimum load			100 mA/24 V
Breaking capacity (A)	VAC	240	5
p.f.: 0.7		380	3
	V DC	24	1.8
		48	1.5
		125	0.4
		250	0.15

M2C: 24 V DC power supplied by control unit (consumption 100 mA). M6C: external 24 V DC power supply required (consumption 100 mA).

# Spare parts

### Lead-seal covers

A lead-seal cover controls access to the adjustment dials.

When the cover is closed:

- it is impossible to modify settings using the keypad unless the settings lockout pin on the cover is removed
- the test connector remains accessible
- the test button for the ground-fault protection function remains accessible.

### Characteristics

- Transparent cover for basic Micrologic and Micrologic A control units
- Non-transparent cover for Micrologic P and H control units.

### Spare batterv

A battery supplies power to the LEDs identifying the tripping causes. Battery service life is approximately ten years.

A test button on the front of the control unit is used to check the battery condition. The battery may be replaced on site when discharged.

# **Test equipment**

### Hand-held test kit

The hand-held mini test kit may be used to:

■ check operation of the control unit and the tripping and pole-opening system by sending a signal simulating a short-circuit

supply power to the control units for settings via the keypad when the circuitbreaker is open (Micrologic P and H control units).

Power source: standard LR6-AA battery.

## Full function test kit

The test kit can be used alone or with a supporting personal computer.

- The test kit without PC may be used to check:
- the mechanical operation of the circuit breaker

■ the electrical continuity of the connection between the circuit breaker and the control unit

- operation of the control unit:
- □ display of settings
- automatic and manual tests on protection functions
- □ test on the zone-selective interlocking (ZSI) function
- □ inhibition of the ground-fault protection
- □ inhibition of the thermal memory.
- The test kit with PC offers in addition:
- the test report (software available on request).

# Portable data acquisition

Masterpact and GetnSet

### GetnSet is a portable data acquisition and storage accessory that connects directly to the Micrologic control units of Masterpact circuit breakers to read important electrical installation operating data and Masterpact protection settings.

This information is stored in the GetnSet internal memory and can be transferred to a PC via USB or Bluetooth for monitoring and analysis.

# **Overview of Masterpact GetnSet functions**

GetnSet <sup>(1)</sup> is a portable data acquisition and storage device that works like a USB drive, letting users manually transfer data to and from a Masterpact circuit breaker or PC.

GetnSet can download operating data from Masterpact and download or upload settings.

Downloadable operating data include measurements, the last 3 trip history records and contact wear status.

Accessible settings include protection thresholds, external relay assignment modes and pre-defined alarm configurations if applicable.

(1) See page F-2 for catalogue numbers.

- 1 On/Off
- 2 batterie indicator3 Download settings
- 4 Download operating parameters
- 5 Upload settings
- 6 USB indicator
- Bluetooth indicator

# **Operating data functions**

Electrical installation information such as energy measurements and contact wear status is increasingly important to help reduce operating expenses and increase the availability of electrical power. Such data is often available from devices within the installation, but needs to be gathered and aggregated to allow analysis and determine effective improvement actions.

With GetnSet, this operating data can be easily read and stored as .dgl files in the internal memory. It can then be transferred to a PC via a USB or Bluetooth link and imported in an Excel spreadsheet.

The provided Excel spreadsheet can be used to display the operating data from several breakers in order to:

- analyse changes in parameters such as energy, power factor and contact wear
- compare the values of parameters between circuit breakers
- create graphics and reports using standard Excel tools

# GetnSet data accessible in the Excel spreadsheet

Type of data	Microl	ogic	
Current	А	Р	Н
Energy, voltages, frequency, power, power factor		Р	Н
Power quality: fundamental, harmonics			Н
Trip history		Р	Н
Contact wear		Р	Н

# Protection setting functions

GetnSet can also be used to back up circuit breaker settings and restore them on the same device or, under certain conditions, copy them to any Masterpact circuit breaker equipped with the same type of Micrologic control unit. This concerns only advanced settings, as other parameters must be set manually using the dials on the Micrologic control unit.

■ When commissioning the installation, safeguard the configuration parameters of your electrical distribution system by creating a back-up of circuit breaker settings so that they can be restored at any time.

■ The settings read by GetnSet can be transferred to a PC and are compatible with RSU software (Remote Setting Utility). Protection configurations can also be created on a PC using this software, copied to GetnSet's internal memory and uploaded to a Masterpact circuit breaker with a compatible Micrologic trip unit and dial settings.

# **Operating procedure**

The procedure includes several steps.

■ Plug GetnSet into the receptacle on the front of the Micrologic control unit of a Masterpact circuit breaker.

■ On the keypad, select the type of data (operating data or settings) and the transfer direction (download or upload). This operation can be done as many times as required for the entire set of Masterpact circuit breakers.

■ Downloaded data is transferred to the GetnSet internal memory and a file is created for each Masterpact device (either an .rsu file for settings or a.dgl file for operating data).

■ Data can be transferred between GetnSet and a PC via a USB or Bluetooth connection.

■ Operating data can be imported in an Excel spreadsheet and protection settings can be read with RSU (remote setting utility) software.

# Features

■ Battery-powered to power a Micrologic control unit even if the breaker has been opened or tripped. This battery provides power for an average of 1 hour of use, enough for more than 100 download operations.

■ Can be used on Masterpact circuit breakers equipped or not equipped with a Modbus "device" communication module.

■ Portable, standalone accessory eliminating the need for a PC to connect to a Masterpact circuit breaker.

- No driver or software required for GetnSet connection to a PC.
- Can be used with many circuit breakers, one after the other.
- Embedded memory sized to hold data from more than 5000 circuit breakers.

■ Supplied with its battery, a cable for connection to Micrologic trip units, a USB cable for connection to a PC and a battery charger.

# Compatibility

Micrologic control units A, P, H

PC with USB port or Bluetooth link and Excel software

# Communication **COM** option in Masterpact

For fixed devices, the COM option is made up of:

connection to XF and MX1 communicating voltage releases.

connection to XF and MX1 communicating voltage releases

For drawout devices, the COM option is made up of:

These contacts remain available for conventional uses.

Modbus "Device" communication module

### The COM option is required for integration of the circuit breaker or switch-disconnector in a supervision system.

Masterpact uses the Modbus communications protocol for full compatibility with electrical-installation management systems.

An external gateway is available for communication on other networks:

- Ion Enterprise (power management system)
- Ethernet gateway (MPS100/EGX)
- Ethernet
- Profibus

Eco COM is limited to the transmission of metering data and does not allow the control of the circuit breaker.

## **Overview of functions**

The Masterpact circuit breakers and switch-disconnectors are compatible with the Modbus COM option.

#### The COM option may be used to:

- identify the device
- indicate status conditions
- control the device.

Depending on the different types of Micrologic (A, P, H) control units, the COM option also offers:

setting of the protection and alarms functions

analysis of the AC-power parameters for operating-assistance and maintenance purposes.

(1) With Modbus it is possible to monitor the PF status please use the instruction bulletin COMBT32AK at page 51/Register 661 documentation.

# Communication

### Masterpact in a communication network

#### Modbus

Gateway

A Modbus TCP gateway can be used to connect the Modbus network to ethernet. The gateway has the two main functions:

- access to the company intranet (Ethernet) by converting Modbus frames to the TCP/Modbus protocol,
- optional web-page server for the information from the devices.
- Examples include MPS100, EGX400 and EGX100.

#### **MPS100**

■ Plug and play device. It comes loaded with a web-page application for graphic display of currents and voltages and viewing of circuit-breaker status and power and energy values.

To use the application, simply declare the Modbus addresses of the connected slaves. Automatically recognised devices include all Masterpact and Compact NSX Micrologic trip units and the PM500/700/800 and PM9c power monitoring units. Can be used for automatic alarm notification via a messaging server available on

- the site intranet or via mobile phones (e-mail converted into SMS).
- Can be used for logging of data that can be automatically sent as e-mail attachments, e.g. a weekly consumption report.

#### **Communication bus**

#### Modbus bus

The Modbus (RS 485) system is an open bus on which communicating Modbus devices (Masterpact with Modbus COM, Sepam, Vigilohm, etc.)

are installed. All types of PLCs and microcomputers may be connected to the bus. Addresses

The Modbus parameters (address, baud rate, parity) are entered using the keypad on the Micrologic A, P or H. For an automatic switch, it is necessary to use the RSU

(Remote Setting Utility) Micrologic utility. The software layer of the Modbus protocol can manage up to 255 addresses (1 to 255).

The "device" communication module comprises three addresses linked to:

- circuit-breaker manager
- measurement manager
- protection manager.

The "chassis" communication module comprises one address linked to the chassis manager.

The division of the system into four managers secures data exchange with the supervision system and the circuit-breaker actuators.

The manager addresses are automatically derived from the circuit-breaker address @xx entered via the Micrologic control unit (the default address is 47).

#### Logic addresses

@xx	Circuit-breaker manager	(1 to 47)	
@xx + 50	Chassis manager	(51 to 97)	
@xx + 200	Measurement manager	(201 to 247)	
@xx + 100	Protection manager	(101 to 147)	

#### Number of devices

The maximum number of devices that may be connected to the Modbus bus depends on the type of device (Masterpact with Modbus COM, PM500, Sepam, Vigilohm, etc.), the baud rate (19200 is recommended), the volume of data exchanged and the desired response time. The RS 485 physical layer offers up to 32 connection points on the bus (1 master, 31 slaves).

A fixed device requires only one connection point (communication module on the device).

A drawout device uses two connection points (communication modules on the device and on the chassis).

The number must never exceed 31 fixed devices or 15 drawout devices.

#### Length of bus

The maximum recommended length for the Modbus bus is 1200 meters.

#### Bus power source

A 24 V DC power supply is required (less than 20 % ripple, insulation class II).

#### Devices

Circuit breakers equipped with Micrologic control units may be connected to either a Digipact or Modbus communication bus. The information made available depends on the type of Micrologic control unit (A, P or H) and on the type of communication bus (Modbus).

Automatic switches can be connected to the Modbus communication bus. The information made available is the status of the automatic switch.

# Communication

# Masterpact and the MPS100 Micro Power

Server

#### The MPS100 Micro Power Server:

notifies maintenance staff when any preset alarm or trip is activated by the Micrologic trip unit, automatically sending an e-mail and/or SMS

data logs are periodically forwarded by e-mail

the e-mails are sent via an Ethernet local area network (LAN) or remotely via modem.

MPS100 Micro Power Server.

Main LV switchboard.

Monitoring of your main LV switchboard via embedded web pages in the MPS100 accessible with a standard web browser.

#### Micro Power Server makes data collection easy for monitoring Masterpact/Compact circuit breakers

Now, more than ever, there is a need to monitor electrical distribution systems in industrial and large commercial applications. The key to managing all equipment, maximising efficiencies, reducing costs and increasing up time is having the right tools.

Micro Power Server MPS100 is designed to withstand harsh electrical environments and provide a consistent flow of easy to interpret information.

# Micro Power Server is designed for unattended operation within the main LV switchboard

The MPS100 is a self-contained facility information server that serves as a standalone device for power system monitoring.

It is used to transfer power system information via a standard web browser over an Ethernet local area network (LAN) or via modem, making it possible to view power system information on a PC with an Ethernet connection.

In either capacity, the Micro Power Server functions as a web server for Micrologic trip unit and Power Meter supervision, automatically notifying (e-mail and/or SMS) maintenance staff when any preset alarm or trip is activated in the Micrologic trip unit.

#### **Benefits**

■ View your main LV switchboard without installing software on your local PC, eliminating the need for a dedicated PC with specific software

Micro Power Server allows centralised monitoring, so you no longer waste precious time walking around the facility to collect data

■ View your main LV switchboard via a modem connection (GSM or switched network), avoiding the need for a LAN

- Maintenance people are automatically notified at any time, wherever they are,
- so you do not have to stay in front of a monitor all day long

Data logs can be periodically forwarded by sending e-mails to the relevant people

- (maintenance, accounting, application service provider) automatically Possibility to monitor/notify six external events (limit switches, auxiliary
- Possibility to monitor/notify switches...)

■ Back-up of Micrologic trip unit settings in the memory of the MPS100, so you know where to retrieve it when necessary.

It is possible to combine the different types of architecture.

#### **Supported Modbus devices**

- Micrologic trip units
- Power Meters (PM700, PM800...).
- Maximum recommended connected devices is 10.

### **Features**

- Access to the power system via a standard PC web browser
- Real-time data displayed with an intuitive and user friendly interface (dashboard)
- Ethernet Modbus TCP/IP connectivity directly to the LAN or via modem (Point to Point Protocol services)
- SMTP (Simple Mail Transfer Protocol) client (capacity to send e-mail)
- Local logging of data such as energy, power, current...
- Set-up and system configuration through MPS100 embedded HTML pages
- User interface translatable in any language, factory settings in English and French ■ 6 inputs/2 outputs (no-volt contact)
- DHCP (Dynamic Host Configuration Protocol) client.

#### **Technical characteristics**

Power supply	24 V DC ±15 %, consumption = 250 mA
Operating temperature	0 to +50°C
Rugged compact metal housing	35 x 218 x 115 mm (H x W x D)
Additional information available at: http://194.2. User name: MPS, Password: MPS100	245.4/mkt/microser.nsf

# Connections

## **Overview of solutions**

#### Three types of connection are available:

- vertical or horizontal rear connectionfront connection (NT only)
- mixed connection.

The solutions presented are similar in principle for all Masterpact NT and NW fixed and drawout devices.

Rear connection Horizontal

ЯS

PB101575A45

DB 109898-54A

Vertical

B101576A45\_SE

Simply turn a horizontal rear connector 90° to make it a vertical connector.

#### Front connection (NT only)

**Mixed connection** 

0 00 000

Note: Masterpact circuit breakers can be connected indifferently with bare-copper, tinned-copper and tinned-aluminium conductors, requiring no particular treatment.

### Accessories

# PB101954A60\_SE

Mounting on a switchboard backplate using special brackets Masterpact NT fixed front-connected circuit breakers can be installed on a backplate without any additional accessories.

Masterpact NW circuit breakers require a set of special brackets.

#### Safety shutters V0

Mounted on the chassis, the safety shutters automatically block access to the disconnecting stabs when the device is in the disconnected or test positions. When the device is removed from its chassis, no live parts are accessible. The shutter-locking system in front may be used to:

- prevents connection of the device
  locks the shutters in the closed position.

## **Locking** On the device

Access to pushbuttons protected by transparent cover.

Pushbutton locking using a padlock.

OFF position locking using a padlock.

OFF position locking using a keylock.

**Pushbutton locking VBP** 

The transparent cover blocks access to the pushbuttons used to open and close the device.

It is possible to independently lock the opening button and the closing button. The locking device is often combined with a remote operating mechanism.

The pushbuttons may be locked using either:

- three padlocks (not supplied)
- lead seal
- two screws.

### Device locking in the OFF position

#### By padlocks (VCPO option) - By keylocks (VSPO option)

The circuit breaker is locked in the OFF position by physically maintaining the opening pushbutton pressed down:

- using padlocks (one to three padlocks, not supplied)
- using keylocks (one or two different keylocks, supplied).

Keys may be removed only when locking is effective (Profalux or Ronis type locks). The keylocks are available in any of the following configurations:

one keylock

one keylock mounted on the device + one identical keylock supplied separately for interlocking with another device

two different key locks for double locking.

Profalux and Ronis keylocks are compatible with each other.

A locking kit (without locks) is available for installation of one or two keylocks (Ronis, Profalux, Kirk or Castell) not supplied.

#### Accessory-compatibility

For Masterpact NT: 3 padlocks or 1 keylock

For Masterpact NW: 3 padlocks and/or 2 keylocks

#### Cable-type door interlock IPA

This option prevents door opening when the circuit breaker is closed and prevents circuit breaker closing when the door is open.

For this, a special plate associated with a lock and a cable is mounted on the right side of the circuit breaker.

With this interlock installed, the source changeover function cannot be implemented.

### On the chassis

"Disconnected" position locking by padlocks.

Door interlock

Racking interlock.

Mismatch protection.

"Disconnected" position locking by keylocks.

#### "Disconnected" position locking By padlocks (standard) or keylocks (VSPD option)

Mounted on the chassis and accessible with the door closed, these devices lock the circuit breaker in the "disconnected" position in two manners:

- using padlocks (standard), up to three padlocks (not supplied)
- using keylocks (optional), one or two different keylocks are available. Profalux and Ronis keylocks are available in different options:
- one keylock
- two different keylocks for double locking
- one (or two) keylocks mounted on the device + one (or two) identical keylocks

supplied separately for interlocking with another device.

A locking kit (without locks) is available for installation of one or two keylocks (Ronis, Profalux, Kirk or Castell) not supplied.

#### "Connected", "disconnected" and "test" position locking

The "connected", "disconnected" and "test" positions are shown by an indicator and are mechanically indexed. The exact position is obtained when the racking handle blocks. A release button is used to free it.

As standard, the circuit breaker can be locked only in "disconnected" position. On request, the locking system may be modified to lock the circuit breaker in any of the three positions: "connected", "disconnected" or "test".

#### Door interlock catch VPEC

Mounted on the right or left-hand side of the chassis, this device inhibits opening of the cubicle door when the circuit breaker is in "connected" or "test" position. It the breaker is put in the "connected" position with the door open, the door may be closed without having to disconnect the circuit breaker.

#### Racking interlock VPOC

This device prevents insertion of the racking handle when the cubicle door is open.

#### Cable-type door interlock IPA

This option is identical for fixed and drawout versions.

#### Racking interlock IBPO between crank and OFF pushbutton for NW (standard)

This option makes it necessary to press the OFF pushbutton in order to insert the racking handle and holds the device open until the handle is removed.

#### Automatic spring discharge DAE before breaker removal for NW (standard)

This mechanism discharges the springs before the breaker is removed from the chassis.

#### Mismatch protection (standard) VDC

Mismatch protection ensures that a circuit breaker is installed only in a chassis with compatible characteristics. It is made up of two parts (one on the chassis and one on

# Indication contacts

#### Indication contacts are available:

■ in the standard version for relay applications ■ in a low-level version for control of PLCs and

electronic circuits. M2C and M6C contacts may be programmed via the

Micrologic P and H control units.

ON/OFF indication contacts OF (microswitch type)

Additional "fault-trip" indication contacts SDE.

Combined contacts

Two types of contacts indicate the ON or OFF position of the circuit breaker:

microswitch type changeover contacts for Masterpact NT

■ rotary type changeover contacts directly driven by the mechanism for Masterpact NW. These contacts trip when the minimum isolation distance between the main circuit-breaker contacts is reached.

#### "Fault-trip" indication contacts SDE

Circuit-breaker tripping due to a fault is signalled by:

a red mechanical fault indicator (reset)

one changeover contact SDE.

Following tripping, the mechanical indicator must be reset before the circuit breaker may be closed. One SDE is supplied as standard. An optimal SDE may be added. This latter is incompatible with the electrical reset after fault-trip option (Res).

SDE				NT/NW
Supplied as standard				1
Maximum number				2
Breaking capacity (A) p.f.: 0.3	Standard			Minimum load: 100 mA/24 V

CCE, CD and CT "connected/disconnected/test" position carriage switches

M2C programmable contacts: circuit-breaker internal relay with two contacts.

M6C programmable contacts:

circuit-breaker external relay with six independent changeover contacts controlled from the circuit breaker via a three-wire connection. (maximum length is 10 meters).

#### "Connected", "disconnected" and "test" position carriage switches

Three series of optional auxiliary contacts are available for the chassis:

changeover contacts to indicate the "connected" position CE

■ changeover contacts to indicate the "disconnected" position CD. This position is indicated when the required clearance for isolation of the power and auxiliary circuits is reached

■ changeover contacts to indicate the "test" position CT. In this position, the power circuits are disconnected and the auxiliary circuits are connected.

#### Additional actuators

A set of additional actuators may be installed on the chassis to change the functions of the carriage switches.

			NT	NW

#### M2C / M6C programmable contacts

These contacts, used with the Micrologic P and H control units, may be programmed via the control unit keypad or via a supervisory station with the COM communication option. They require an external power supply module. They indicate:

- the type of fault
- instantaneous or delayed threshold overruns.
- They may be programmed:
- with instantaneous return to the initial state
- without return to the initial state

with return to the initial state following a delay.

Characteristics			
Minimum load			100 mA/24 V

p.f.: 0.7		380	3
	V DC	24	1.8
		48	1.5
		125	0.4
		250	0.15

### **Remote operation** Remote ON / OFF

Two solutions are available for remote operation of Masterpact devices:

- a point-to-point solution
- a bus solution with the COM communication option.

- an electric motor MCH equipped with a "springs charged" limit switch contact CH
- two voltage releases:
- □ a closing release XF □ an opening release MX.

Note: an opening order always takes priority over a closing order.

If opening and closing orders occur simultaneously, the mechanism discharges without any movement of the main contacts. The circuit breaker remains in the open position (OFF).

In the event of maintained opening and closing orders, the standard mechanism provides an anti-pumping function by blocking the main contacts in open position.

DB 101165

Anti-pumping function. After fault tripping or intentional opening using the manual or electrical controls, the closing order must first be discontinued, then reactivated to close the circuit breaker.

Note: MX communicating releases are of the impulse type only and cannot be used to lock a circuit breaker in OFF position. For locking in OFF position, use the remote tripping function (2nd MX or MN).

When MX or XF communicating releases are used, the third wire (C3, A3) must be connected even if the communication module is not installed. When the control voltage (C3-C1 or A3-A1) is applied to the MX or XF releases, it is necessary to wait 1.5 seconds before issuing an order. Consequently, it is advised to use standard MX or XF releases for applications such as source-changeover systems.

- Optionally, other functions may be added:
- a "ready to close" contact PF an electrical closing pushbutton BPFE
- remote reset following a fault RES.

A remote-operation function is generally combined with:

- device ON / OFF indication OF
- "fault-trip" indication SDE.

#### Wiring diagram of a point-to-point remote ON / OFF function

#### Wiring diagram of a bus-type remote ON / OFF function

A-36

Electric motor MCH for Masterpact NT.

Electric motor MCH for Masterpact NW.

XF and MX voltage releases.

"Ready to close" contacts PF.

#### **Electric motor MCH**

The electric motor automatically charges and recharges the spring mechanism when the circuit breaker is closed. Instantaneous reclosing of the breaker is thus possible following opening. The spring-mechanism charging handle is used only as a backup if auxiliary power is absent.

The electric motor (MCH) is equipped as standard with a limit switch contact (CH) that signals the "charged" position of the mechanism (springs charged).

#### Characteristics

Power supply	V AC 50/60 Hz	48-60, 100-130, 200-250, 277-415, 380-415, 440-480
	V DC	24-30, 48-60, 100-130, 200-250
Operating thres	hold	0.85 to 1.1 Un
Consumption (\	/A or W)	180
Motor overcurre	ent	2 to 3 In for 0.1 s
Charging time		maximum 3 s for Masterpact NT
		maximum 4 s for Masterpact NW
Operating frequ	iency	maximum 3 cycles per minute
CH contact		10 A at 240 V

#### Voltage releases XF and MX

Their supply can be maintained or automatically disconnected.

#### Closing release XF

The XF release remotely closes the circuit breaker if the spring mechanism is charged. **Opening release MX** 

The MX release instantaneously opens the circuit breaker when energised. It locks the circuit breaker in OFF position if the order is maintained (except for MX "communicating" releases).

**Note:** whether the operating order is maintened or automatically disconnected (pulse-type), XF or MX "communicating" releases ("bus" solution with "COM" communication option) always have an impulse-type action (see diagram).

Characteris	stics	XF	MX1

Operating three	shold	0.85 to 1.1 Un	0.7 to 1.1 Un		
Consumption (	VA or W)	Hold: 4.5 Pick-up: 200 (200 ms)	Hold: 4.5 Pick-up: 200 (200 ms)		
Circuit-breaker	response time at	55 ms ±10 (Masterpact NT)	50 ms ±10		
Un		70 ms ±10 (NW ≤ 4000A)			
		80 ms ±10 (NW > 4000A)			

#### "Ready to close" contact PF

The "ready to close" position of the circuit breaker is indicated by a mechanical indicator and a PF changeover contact. This signal indicates that all the following are valid:

- the circuit breaker is in the OFF position
- the spring mechanism is charged
- a maintained opening order is not present:
- □ MX energised
- □ fault trip
- □ remote tripping (second MX or MN)
- □ device not completely racked in
- □ device locked in OFF position
- device interlocked with a second device.

## Remote operation Remote ON/OFF

- Electrical closing pushbutton (BPFE).

#### **Electrical closing pushbutton BPFE**

Located on the front panel, this pushbutton carries out electrical closing of the circuit breaker. It is generally associated with the transparent cover that protects access to the closing pushbutton.

Electrical closing via the BPFE pushbutton takes into account all the safety functions that are part of the control/monitoring system of the installation.

The BPFE connects to the closing release XF in place of the COM module. The COM module is incompatible with this option;

Different types of voltage exist and the XF electromagnet is compulsary if the BPFE option is selected.

#### Remote reset after fault trip

#### Electrical reset after fault trip RES

Following tripping, this function resets the "fault trip" indication contacts SDE and the mechanical indicator and enables circuit breaker closing. Power supply: 110 / 130 V AC and 200 / 240 V AC. The use of a XF closing release is compulsory with this option.

#### Automatic reset after fault trip RAR

Following tripping, a reset of the mechanical indicator (reset button) is no longer required to enable circuit-breaker closing. The mechanical (reset button) and electrical SDE indications remain in fault position until the reset button is pressed. The use of a XF closing release is compulsory with this option.

### Remote tripping

MX or MN voltage release.

- This function opens the circuit breaker via an electrical order. It is made up of:
- a shunt release second MX
- or an undervoltage release MN

or a delayed undervoltage release (MN + delay unit).

These releases (2<sup>nd</sup> MX or MN) cannot be operated by the communication bus. The delay unit, installed outside the circuit breaker, may be disabled by an emergency OFF button to obtain instantaneous opening of the circuit breaker.

#### Wiring diagram for the remote-tripping function

#### Voltage releases second MX

When energised, the MX voltage release instantaneously opens the circuit breaker. A continuous supply of power to the second MX locks the circuit breaker in the OFF position

Characteristics					
Power supply	V AC 50/60Hz	24, 48, 100-130, 200-250, 277, 380/480			
	V DC	12, 24-30, 48-60, 100-130, 20	00-250		
Operating threshold		0.7 to 1.1 Un			
Permanent locking function		0.85 to 1.1 Un			
Consumption (VA or	rW)	Pick-up: 200 (80 ms)	Hold: 4.5		
Circuit-breaker resp	onse time at Un	50 ms ±10			

#### Instantaneous voltage releases MN

The MN release instantaneously opens the circuit breaker when its supply voltage drops to a value between 35 % and 70 % of its rated voltage. If there is no supply on the release, it is impossible to close the circuit breaker, either manually or electrically. Any attempt to close the circuit breaker has no effect on the main contacts. Circuit-breaker closing is enabled again when the supply voltage of the release returns to 85 % of its rated value.

#### Characteristics

Characteristics			
Power supply	V AC 50/60 Hz	24, 48, 100-130, 200-250, 277, 380/480	
	V DC	12, 24-30, 48-60, 100-130, 200-250

# Accessories

Auxiliary terminal shield CB

terminal block of the electrical auxiliaries.

#### **Operation counter CDM**

The operation counter sums the number of operating cycles and is visible on the front panel. It is compatible with manual and electrical control functions.

Optional equipment mounted on the chassis, the shield prevents access to the

#### **Escutcheon CDP**

Optional equipment mounted on the door of the cubicle. The escutcheon increases the degree of protection to IP 40 (circuit breaker installed free standing: IP30). It is available in fixed and drawout versions.

#### Blanking plate OP for escutcheon

Used with the escutcheon, this option closes off the door cut-out of a cubicle not yet equipped with a device. It may be used with the escutcheon for both fixed and drawout devices.

#### Transparent cover CCP for escutcheon

Optional equipment mounted on the escutcheon, the cover is hinged and secured by a screw. It increases the degree of protection to IP54, IK10. It adapts to drawout devices.

Escutcheon CDP with blanking plate.

Transparent cover CCP for escutcheon.

# Source-changeover systems

Presentation

#### Manual source-changeover system

- A manual source-changeover system is made up of:
  two circuit-breakers or automatic switches operated by connecting rods or two or
- three circuit-breakers or automatic switches operated by cables
- a mechanical interlocking system using connecting rods or cables.

Service sector:

- hospital operating rooms
- safety systems for tall buildings
   computer rooms (banks, insurance companies, etc.)
   lighting systems in shopping centres.

Industry:

- assembly lines
- propulsion systems on ships essential auxiliaries in thermal power stations...

PB100846

PB100847A

Infrastructure:

port and railway installations

runway lighting systems
 control systems for military installations...

### Source-changeover systems Mechanical interlocking

Mechanical interlocking enhances the reliability of the source-changeover system.

Interlocking of two Masterpact circuit breakers using cables.

#### Interlocking of two Masterpact devices using cables

To ensure a continuous supply of electrical power, certain installations are connected to two sources:

- a normal source N
- a replacement source R used to supply the installation when the normal source is unavailable.

A source-changeover system switches the load between these two sources. It can be automated to manage transfers according to external conditions. A source-changeover system includes two or three circuit breakers or automatic switches.

#### Interlocking of two Masterpact devices using connecting rods

The two devices must be mounted one above the other.

- This function requires:
- an adaptation fixture on the right side of each circuit breaker or automatic switch
   a set of connecting rods with no-slip adjustments.

The adaptation fixtures, connecting rods and circuit breakers or automatic switches are supplied separately, ready for assembly.

The maximum vertical distance between the fixing planes is 900 mm.

# Possible combinations of Masterpact "Normal" and "Replacement" source circuit breakers

Devices to	Devices to be interlocked		NT		
		Fixed	Drawout	Fixed	Drawout
NT	Fixed	•	-	-	-
	Drawout	-	-	-	-
NW	Fixed	-	-	•	•
	Drawout	-	-	=	=

#### Interlocking of two or three Masterpact devices using cables

For cable interlocking, the circuit breakers may be mounted one above the other or side-by-side.

#### Interlocking between two devices (Masterpact NT or NW) This function requires:

an adaptation fixture on the right side of each circuit breaker or automatic switch
 a set of cables with no-slip adjustments.

The maximum distance between the fixing planes (vertical or horizontal) is 2000 mm with a radius of curvature of at least 100 mm.

For longer distances, please consult us.

#### Interlocking between three devices (Masterpact NW only) This function requires:

■ a specific adaptation fixture for each type of interlocking, installed on the right side of each circuit breaker or automatic switch

two or three sets of cables with no-slip adjustments.

The maximum distance between the fixing planes (vertical or horizontal) is 2000 mm with a radius of curvature of at least 100 mm.

For longer distances, please consult us.

#### Installation

The adaptation fixtures, sets of cables and circuit breakers or automatic switches are supplied separately, ready for assembly.

# Possible combinations of Masterpact "Normal" and "Replacement" source circuit breakers

All combinations of Masterpact NT and Masterpact NW devices are possible. The interlocked devices can be fixed, drawout, 3-pole or 4-pole versions with different ratings and sizes.

Schneider A-43

### schneider-electric.com

CAD software and tools

This international site allows you to access all the Schneider Electric products in just 2 clicks via comprehensive range datasheets, with direct links to: • complete library: technical documents, catalogs, FAQs, brochures...

• selection guides from the e-catalog.

• product discovery sites and their Flash animations. You will also find illustrated overviews, news to which you can subscribe, the list of country contacts... The CAD software and tools enhance productivity and safety. They help you create your installations by simplifying product choice through easy browsing in the Schneider Electric offers.

Last but not least, they optimise use of our products while also complying with standards and proper procedures.

Metal parts	0	0	4.36	111		

# Installation in switchboard

#### **Possible positions**

DB101427

#### **Power supply**

Masterpact devices can be supplied either from the top or from the bottom without reduction in performance, in order to facilitate connection when installed in a switchboard.

#### Mounting the circuit-breaker

It is important to distribute the weight of the device uniformily over a rigid mounting surface such as rails or a base plate.

This mounting plane should be perfectly flat (tolerance on support flatness: 2 mm). This eliminates any risk of deformation which could interfere with correct operation of the circuit breaker.

Masterpact devices can also be mounted on a vertical plane using the special brackets.

Mounting with vertical brackets.

# Installation recommendations

#### Partitions

Sufficient openings must be provided in partitions to ensure good air circulation around the circuit breaker; Any partition between upstream and downstream connections of the device must be made of nonmagnetic material.

For high currents, of 2500 A and upwards, the metal supports or barriers in the immediate vicinity of a conductor must be made of non-magnetic material **A**. Metal barriers through which a conductor passes must not form a magnetic loop.

A : non magnetic material.

#### **Busbars (NT, NW)**

The mechanical connection must be exclude the possibility of formation of a magnetic loop around a conductor.

#### **Busbars (NT)**

For live busbars installed immediately above the circuit breaker (respecting the 100 mm safety clearance), the distance between bars must be 65 mm minimum. In a 1000 V system, the bars must be insulated.

# **Door interlock**

#### **Door interlock**

Mounted on the right or left-hand side of the chassis, this device inhibits opening of the cubicle door when the circuit breaker is in "connected" or "test" position. It the breaker is put in the "connected" position with the door open, the door may be closed without having to disconnect the circuit breaker.

#### Cable-type door interlock

This option prevents door opening when the circuit breaker is closed and prevents circuit breaker closing when the door is open.

For this, a special plate associated with a lock and a cable is mounted on the right side of the circuit breaker.

With this interlock installed, the source changeover function cannot be implemented.

Note: the door interlock can either be mounted on the right side or the left side of the breaker. F : datum.

Installation recommendations

## (UL) SE

# **Control wiring**

#### Wiring of voltage releases

During pick-up, the power consumed is approximately 150 to 200 VA. For low control voltages (12, 24, 48 V), maximum cable lengths are imposed by the voltage and the cross-sectional area of cables.

#### Recommended maximum cable lengths (meter)

		12 V		24 V		48 V	
		2.5 mm <sup>2</sup>	1.5 mm <sup>2</sup>	2.5 mm <sup>2</sup>	1.5 mm <sup>2</sup>	2.5 mm <sup>2</sup>	1.5 mm <sup>2</sup>
MN	U source 100 %	-	-	58	35	280	165
	U source 85 %	-	-	16	10	75	45
MX-XF	U source 100 %	21	12	115	70	550	330
	U source 85 %	10	6	75	44	350	210

Note: the indicated length is that of each of the two wires.

#### 24 V DC power-supply module

#### External 24 V DC power-supply module for Micrologic (F1-, F2+) (see page D-2 and page D-4)

Do not connect the positive terminal (F2+) to earth

■ The negative terminal (F1-) can be connected to earth, except in IT systems

A number of Micrologic control units and M6C modules can be connected to the same 24 V DC power supply (the consumption of a Micrologic control unit or an M6C module is approximately 100 mA)

Do not connect any devices other than a Micrologic control unit or an M6C module ■ The maximum length for each conductor is ten metres. For greater distances, it is advised to twist the supply wires together

■ The 24 V DC supply wires must cross the power cables perpendicularly. If this is difficult, it is advised to twist the supply wires together

The technical characteristics of the external 24 V DC power-supply module for Micrologic control units are indicated on page A-20.

#### **Communication bus**

■ Do not connect the positive terminal (E1) to earth

■ The negative terminal (E2) can be connected to earth

Anumber of "device" or "chassis" communication modules can be connected to the same 24 V DC power supply (the consumption of each module is approximately 30 mA) ■ The 24 V DC (E1, E2) power supply for the communication bus must be separate

from the external 24 V DC power-supply module for Micrologic control units (F1-, F2+).

E1	E2	E3	E4	E5	E6+

7	24 V	Red
8	A' / Rx <sup>-</sup>	White
9	A / Tx <sup>-</sup>	Brown

Wiring of ZSI: It is recommended to use twisted shielded cable. The shield must be connected to earth at both ends.

#### **Cable connections**

If cables are used for the power connections, make sure that they do not apply excessive mechanical forces to the circuit breaker terminals. For this, make the connections as follows:

extend the circuit breaker terminals using short bars designed and installed according to the

recommendations for bar-type power connections:

- □ for a single cable, use solution **B** opposite □ for multiple cables, use solution **C** opposite.
- in all cases, follow the general rules for connections to busbars:
- □ position the cable lugs before inserting the bolts
- □ the cables should firmly secured to the framework E.

#### **Busbar connections**

The busbars should be suitably adjusted to ensure that  $\frac{1}{2}$ the connection points are positioned on the terminals before the bolts are inserted B.

The connections are held by the support which is solidly fixed to the framework of the switchboard, such that the circuit breaker terminals do not have to support its weight C. (This support should be placed close to the terminals).

#### Electrodynamic stresses

The first busbar support or spacer shall be situated within a maximum distance from the connection point of the breaker (see table below). This distance must be respected so that the connection can withstand the electrodynamic stresses between phases in the event of a short circuit.

Maximum distance A between busbar to circuit breaker connection and the first busbar support or spacer with respect to the value of the prospective short-circuit current						
Icc (kA)	30	50	65	80	100	150
Distance A (mm)	350	300	250	150	150	150

### Installation recommendations

# **Power connection**

#### Clamping

Correct clamping of busbars depends amongst other things, on the tightening torques used for the nuts and bolts. Over-tightening may have the same consequences as under-tightening.

For connecting busbars (Cu ETP-NFA51-100) to the circuit breaker, the tightening torques to be used are shown in the table below.

These values are for use with copper busbars and steel nuts and bolts, class 8.8. The same torques can be used with AGS-T52 quality aluminium bars (French standard NFA 02-104 or American National Standard H-35-1).

Examples

Terminal screw factory-tightened to 16 Nm (NW), 13 Nm (NT). 1

- Breaker terminal.
- Busbar.
- 2 3 4 Bolt.
- 5 Was 6 Nut. Washer.

**Tightening torques** Tightening torques (Nm) Ø (mm) Ø (mm) Drilling Nominal with grower or flat washers 37.5 11

Tightening torques (Nm) with contact or corrugated washers 50

#### **Busbar drilling**

10

#### **Isolation distance**

#### **Dimensions (mm)**

Ui		X min
600 V		8 mm
1000 V		14 mm

#### **Busbar bending**

When bending busbars maintain the radius indicated below (a smaller radius would cause cracks).

#### **Dimensions (mm)**

e	Radius of curvature (r) Min Recommended		
5	5	7.5	
10	15	18 to 20	

#### Installation recommendations

The requirements for the connectors and connection bars are shown in the table below.

**Note**: the installer is responsible for the connection of the bars to the circuit breaker connectors. The bars must be supported by the switchboard framework, with no weight on the connectors. **Bar dimensions** 

Circuit breaker		Standard	Connector	Connection bars	
Rating (A)	Туре			Number	Dimensions
800,1200	N/H/L1/HF	UL 489	RC-H, RC-V, FC	1	0.25 x 3 in. (6 x 76 mm)
1600	N/H/HF	UL 489	RC-H, RC-V, FC	2	0.25 x 3 in. (6 x 76 mm)

Schneider B-11

### schneider-electric.com

Training

This international site allows you to access all the Schneider Electric products in just 2 clicks via comprehensive range datasheets, with direct links to: • complete library: technical documents, catalogs, FAQs, brochures...

• selection guides from the e-catalog.

• product discovery sites and their Flash animations. You will also find illustrated overviews, news to which you can subscribe, the list of country contacts... Training allows you to acquire the Schneider Electric expertise (installation design, work with power on, etc.) for increased efficiency and a guarantee of improved customer service.

The training catalogue includes beginner's courses in electrical distribution, knowledge of MV and LV switchgear, operation and maintenance of installations, design of LV installations to give but a few examples.

The electrical	
installation guide	ڊ

## According to IEC 60364

This guide, part of the Schneider Electric offer, is the essential tool to "guide" you any time in your business:

- design office, consultant
- ${\scriptstyle \bullet}$  contractor, panelbuilder
- teacher, trainer.

# Comprehensive and concrete information on:

- all the new technical solutions
- all the components
- of an installation from a global point of view
- all the IEC standards modifications
- all the fundamental
- electrotechnical knowledge
- all the design stages, from medium to low voltage.

## Masterpact NT and NW

# Communications option 24 V DC external power supply

#### Connection of the communications option

None of the control-unit protection functions require an auxiliary source. However, the 24 V DC external power-supply (AD module) is required for certain operating configurations as indicated in the table below:

Circuit breaker	Closed	Open	
Voltage measurement inputs	Powered	Powered	Not powered
M2C, M6C programmable contacts option	Yes	Yes	Yes
Protection function	No	No	No
Display function	No <sup>(2)</sup>	No <sup>(3)</sup>	Yes
Time-stamping function	No	No	Yes <sup>(4)</sup>
Circuit-breaker status indications and control via communications bus	No	No	No
Identification, settings, operation and maintenance aids via communications bus	No <sup>(2)</sup>	No <sup>(3)</sup>	Yes

(1) Drawout device equipped with Modbus chassis COM.

(2) Except for Micrologic A control units (if current < 20 % In).

(3) Except for Micrologic A control units.

(4) Time setting is manual and can be carried out automatically

by the supervisor via the communications bus.

The communications bus requires its own 24 V DC power source (E1, E2). This source is not the same as the 24 V DC external power-supply module (F1-, F2+)

In case of using the 24 V DC external power supply (AD module), maximum cable length between 24 V DC (G1, G2) and the control unit (F1-, F2+) must not exceed 10 meters.

The BAT battery module, mounted in series upstream of the AD module, ensures an uninterrupted supply of power if the AD module power supply fails.

The voltage measurement inputs are standard equipment on the downstream connectors of the circuit breaker.

External connections are possible using the PTE external voltage measurement input option. With this option, the internal voltage measurement inputs are disconnected and terminals VN, V1, V2, V3 are connected only to the control unit (Micrologic P and H only). The PTE option is required for voltages less than 220 V and greater than 690 V (in which case a voltage transformer is compulsory). For three-pole devices, the system is supplied with terminal VN connected only to the control unit (Micrologic P and H).

When the PTÉ option is implemented, the voltage measurement input must be protected against short-circuits. Installed as close as possible to the busbars, this protection function is ensured by a P25M circuit breaker (1 A rating) with an auxiliary contact (cat. no. 21104 and 21117). This voltage measurement input is reserved exclusively for the control unit and must not ever be used to supply other circuits outside the switchboard.

#### Switchboard display unit

This architecture provides remote display of the variables managed by Micrologic control units equipped with the COM Modbus module:

- I (Micrologic A)
- I, U, P, E (Micrologic P)
  I, U, P, E, THD (Micrologic H)
- No programming is required.

For Micrologic A control unit (if current < 20 % In), it is recommended to use the 24 V DC external power supply (AD module).

#### **Communicating switchboard**

This configuration provides remote display and control of Masterpact equipped with the Modbus COM module.

## **Electrical diagrams**

# Masterpact NT and NW

Ground-fault protection Neutral protection Zone selective interlocking

#### External sensor (CT) for residual ground-fault protection

# Connection of current-transformer secondary circuit for external neutral

Masterpact equipped with a Micrologic 6 A/P/H: shielded cable with 2 twisted pairs

- T1 twisted with T2
- maximum length 10 meters
- cable cross-sectional area 0.4 to 1.5 mm<sup>2</sup>

■ recommended cable: Belden 9552 or equivalent. For proper wiring of neutral CT, refer to instruction Bulletin 48041-082-01 shipped with it. Do not remove factory-installed jumper between T1

and T2 unless neutral CT is connected.

Do not install jumper between T3 and T4.

If supply is via the top, follow the shematics. If supply is via the bottom, control wiring is identical; for the power wiring, H1 is connected to the source side,

H2 to the load side. For four-pole versions, for residual ground-fault protection, the current transformer for the external

neutral is not necessary. Connection for signal VN is required only for power

Connection for signal VN is required only for power measurements (3  $\emptyset$ , 4 wires, 4 CTs).

#### External transformer for source ground return (SGR) ground-fault protection

#### Connection of the secondary circuit:

Masterpact equipped with a Micrologic 6 A/P/H:

- unshielded cable with 1 twisted pair
- maximum length 150 meters
- cable cross-sectional area 0.4 to 1.5 mm<sup>2</sup>
- terminals 5 and 6 may not be used at the same time
- use terminal 5 for NW08 to 30
- use terminal 6 for NW40 to 50
- recommended cable: Belden 9409 or equivalent.

three pole circuit breaker:

□ Masterpact equipped with Micrologic P or H

□ the current transformer for external neutral is

necessary (the wiring diagram is identical to the one used for the residual ground-fault protection)

■ four pole circuit breaker:

□ Masterpact equipped with Micrologic A, P or H the current transformer for external neutral is not necessary

Zone-selective interlocking is used to reduce the electrodynamic forces exerted on the installation by shortening the time required to clear faults, while maintaining time discrimination between the various devices.

A pilot wire interconnects a number of circuit breakers equipped with Micrologic A/P/H control units, as illustrated in the diagram above.

The control unit detecting a fault sends a signal upstream and checks for a signal arriving from downstream. If there is a signal from downstream, the circuit breaker remains closed for the full duration of its tripping delay. If there is no signal from downstream, the circuit breaker opens immediately, regardless of the tripping-delay setting.

#### Fault 1:

Only circuit breaker A detects the fault. Because it receives no signal from downstream, it opens immediately, regardless of its tripping delay set to 0.3.

#### Fault 2:

Circuit breakers A and B detect the fault. Circuit breaker A receives a signal from B and remains closed for the full duration of its tripping delay set

to 0.3. Circuit breaker B does not receive a signal from downstream and opens immediately, in spite of its tripping delay set to 0.2.

Note: the maximum permissible distance between two devices is 3000 m. A downstream circuit breaker can "control" up to ten upstream circuit breakers.

The technical guide

This international site allows you to access all the Schneider Electric products in just 2 clicks via comprehensive range datasheets, with direct links to: • complete library: technical documents, catalogs, FAQs, brochures...

• selection guides from the e-catalog.

• product discovery sites and their Flash animations. You will also find illustrated overviews, news to which you can subscribe, the list of country contacts... These technical guides help you comply with installation standards and rules i.e.: the electrical installation quide, the protection guide, the switchboard implementation guide, the technical booklets and the co-ordination tables all form genuine reference tools for the design of high performance electrical installations. For example, the LV protection co-ordination guide - discrimination and cascading - optimises choice of protection and connection devices while also increasing markedly continuity of supply in the installations.

# NW08 to NW50 drawout circuit breakers

**Circuit breakers** 

### A Masterpact drawout circuit breaker is described by 5 catalogue numbers corresponding to:

- the basic circuit breaker
- a control unit
- a chassis
- a top connection see page F-18
- a bottom connection see page F-18.

A communication option and various auxiliaries and accessories may also be added.

Basic circuit breaker + chassis ≤ 3000 A.

Basic circuit breaker + chassis > 3000 A.

Chassis ≤ 3000 A.

# NW08 to NW50 switch-disconnectors

Switch-disconnectors

#### A Masterpact fixed switch-disconnector is described by

- 3 catalogue numbers corresponding to:
- the basic switch-disconnector
- a top connection see page F-14
- a bottom connection see page F-14.

A communication option and various auxiliaries and accessories may also be added.

Basic switch-disconnector ≤ 3000 A.

Basic switch-disconnector > 3000 A.

A Masterpact drawout switch-disconnector is described by 4 catalogue numbers corresponding to:

- the basic switch-disconnector
- a chassis
- a top connection see page F-18
- a bottom connection see page F-18.

A communication option and various auxiliaries and accessories may also be added.

Basic switch-disconnector + chassis ≤ 3000 A.

Basic switch-disconnector + chassis > 3000 A.
